# KITA evaluation checklist

Based on Notes-Kita-app.docx. This checklist covers the evaluator notes, not the separate role-based capstone checklist.

**DONE** = already present. **ADDED** = implemented in this work session. **PENDING** = activation, acceptance or policy review remains.

**Release status:** New code is tested locally, but the new database migration has not been applied. The local MySQL server was unavailable at the last connection check. Deployment and live-browser acceptance are not verified.

## 1. Inventory management

| STATUS | REQUIREMENT / CURRENT BEHAVIOR |
|---|---|
| **DONE** | Track each delivery as a separate inventory batch. |
| **DONE** | Preserve old and new acquisition costs without overwriting historical batch costs. |
| **DONE** | Keep retail selling price separate from acquisition cost; retain retail price when desired. |
| **DONE** | Track remaining batch quantities and total on-hand stock. |
| **ADDED** | Use strict FIFO by received date, then batch ID, among eligible batches. |
| **DONE** | Record which batches and original costs were consumed by each sale. |
| **ADDED** | Show sellable quantities separately from stock still on hand; exclude expired/recalled batches from sales. |

## 2. Purchase orders and receiving

| STATUS | REQUIREMENT / CURRENT BEHAVIOR |
|---|---|
| **DONE** | Record ordered quantities, actual deliveries and remaining undelivered quantities. |
| **DONE** | Support partial deliveries, with receiving history linked to the purchase order. |
| **DONE** | Save actual delivery dates and a separate batch for each receipt. |
| **DONE** | Save delivery-specific costs, batch identifiers and expiration dates. |
| **DONE** | Post actual received quantities and protect against duplicate receiving submissions. |
| **ADDED** | Optionally record manufacturing dates; reject dates after the delivery date. |
| **ADDED** | Display manufacturing dates in batch history and received-stock reports/exports. |

# Expiration and sales

Expiry policy implemented: a batch is blocked from sale on its expiration date and afterward, using the configured business timezone (default Asia/Manila).

## 3. Expiration monitoring

| STATUS | REQUIREMENT / CURRENT BEHAVIOR |
|---|---|
| **ADDED** | Use current business dates and remaining batch stock in the dashboard expiry widget. |
| **DONE** | List expired and approaching-expiry batches using a configurable days-ahead window. |
| **ADDED** | Default the monitoring window to seven days. |
| **ADDED** | Notify active managers/admins about stock expiring within seven days; flag expired batches as Critical. |
| **ADDED** | Avoid duplicate notifications for the same recipient, batch, expiry date and alert stage. |
| **ADDED** | Generate alerts during notification polling; provide an hourly scheduled command. |
| **ADDED** | Open a prefilled disposal action from the expiry list; manager confirmation records pull-out. |
| **DONE** | Deduct pulled-out quantities from batch and product balances with an audit trail. |

## 4. Sales, returns and exchanges

| STATUS | REQUIREMENT / CURRENT BEHAVIOR |
|---|---|
| **DONE** | Deduct stock automatically and continue to the next batch when the older eligible batch runs out. |
| **DONE** | Preserve batch acquisition costs and recorded sale prices when later deliveries change costs. |
| **DONE** | Require manager approval for refunds, exchanges and voids; record returned quantities and sales adjustments. |
| **DONE** | Refund damaged goods without restocking; restore eligible returns to their original batches. |
| **ADDED** | Reject restocking expired or recalled returns. Canceled payment reservations restore physical stock without making expired stock sellable. |
| **ADDED** | Exchange a full cash purchase for one replacement of equal or higher value; collect the cash difference and calculate change. |
| **ADDED** | Create a linked replacement sale with purchase credit, sale lines, stock allocations and a printable receipt. |
| **ADDED** | Allow subsequent refunds of the replacement sale. Lower-value or wallet exchanges use refund plus a new sale. |

# Reports and remaining checks

The code work below does not establish the store policy or replace the approved project scope and defense acceptance review.

## 5. Reports

| STATUS | REQUIREMENT / CURRENT BEHAVIOR |
|---|---|
| DONE | Provide separate report choices: Sales lines, Current inventory, Received stock and Stock movements. |
| DONE | Use distinct Report type, Category and Subcategory labels with filtered tables below the controls. |
| ADDED | Limit the primary filter row to Category, Subcategory, Date range and More filters (three controls for current inventory). |
| ADDED | Move Brand, Supplier and Product into More filters; show Low stock only for current inventory. |
| DONE | Update results automatically; show details before export; support PDF, CSV and printing. |
| ADDED | Include on-hand versus sellable stock in inventory reports and manufacturing/expiry dates in received-stock reports. |

## 6. Pending activation and acceptance

| STATUS | REQUIREMENT / CURRENT BEHAVIOR |
|---|---|
| PENDING | Start the local MySQL server, apply migration 2026_10_12_000001_complete_evaluation_workflows, and verify the app against that database. |
| PENDING | Verify deployment and scheduler operation. Scheduled alerts require Laravel scheduling; polling also generates alerts while users are signed in. |
| PENDING | Run browser acceptance for receiving, expiry pull-out, exchanges, replacement receipts and report exports. No connected browser was available. |
| PENDING | Confirm the implemented expiry-day cutoff and return/exchange conditions with the store; review short-shelf-life grocery practices. |
| PENDING | Confirm the four report types and optional manufacturing dates against the approved capstone scope. |

## Verification recorded

**73 targeted backend tests passed (835 assertions).** Backup/restore regression checks also passed: 10 tests, 34 assertions. Five targeted frontend scripts passed, covering the new controls, report behavior and inventory workflows.

The broader suite is not entirely green: an older product-registration test expects a duplicate product to be accepted, and an existing frontend navigation test also fails on the original code. These are separate from the targeted checks above.

**Defense demo:** Receive 28 of 30 ordered units; receive batches at PHP 9 and PHP 12; sell across batches; inspect a seven-day expiry alert; pull out expired stock; refund an eligible item; exchange for a higher-value item; filter and export a report. These exact demonstrations still require acceptance sign-off.
